File Handoff Verification Kit

Streaming SHA256 manifests, sender/receiver comparisons, and editable handoff records.

Choose files or a folder

Select a local folder or several files. Folder selections remove only the common top folder name so the same handoff can be compared at another location. Relative filenames are retained in the manifest. Review the list before sharing it.

Hash without a whole-file memory copy

The app reads files in one-megabyte slices and calculates SHA256 incrementally. Progress and cancellation are visible. Time depends on file size and your computer; the product makes no transfer-speed claim. No selected file is sent to a network service.

01 / Input record

Purpose
Check the contents of a file handoff.

Fictional input
Sender: alpha.txt and beta.txt. Receiver: alpha.txt and extra.txt. The sample digests are computed from the supplied fictional text.

Units and input scope
Compare relative paths, byte sizes and SHA256. This app neither transfers files nor proves who created them.

Input version
Example version 1; record a new version after changing an input.
